

Discoverability & Structured Content Package

Page	User task	Title	Description	Canonical	H1
Home/index	Learn about the school, its programs, and events.	Advanced American Academy Private School in Houston, Toddler to 12th Grade	Advanced American Academy is an accredited private school in Houston serving toddlers through 12th grade. Read about our mission, programs, and upcoming events.	Self	Advanced American Academy
Admissions	See the enrollment steps and enroll.	Admissions and Enrollment Steps Advanced American Academy	See the four steps to enroll at Advanced American Academy, from the application and student testing to the final tuition agreement.	Self	Admissions
Tuition	Look up fees by grade.	Tuition and Fees by Grade Advanced American Academy	View tuition and fees at Advanced American Academy, including the \$50 enrollment fee and annual tuition per student for each grade	Self	Tuition & Fees

			level.		
Contact	Send the school a message.	Contact Us Advanced American Academy	Send a message or question to Advanced American Academy. Fill in your name, email, and message, and add a phone number if desired.	Self	Contact Us

I used index.html as the canonical for home so that it matches my og:url and JSON-LD.

Headings & Links

- Each page has one h1 and no skipped heading levels.
- The nav links to all 4 pages from every page. The logo links to the home page, and the footer links to the contact page.
- Enroll now used to go to “#”. It now goes to a Sycamore link, which was a part of my early planning for my capstone.

Canonical, Robots, & Sitemap

- Canonical (now): the home page loads at both / and /index.html; every page has a self-referencing canonical.
- Robots (not at all): robots.txt only works at the domain root. The domain root is talyous1.github.io, as the AAA site is in a subfolder of my GitHub.
- Sitemap (after publication): Google says that small, well-linked websites usually don't need one. I will add one if the site grows.

Social Metadata

The Home page has og:title, og:description, og:url, og:type, og:image, and og:image:alt. The LinkedIn post checker showed the right title, description, and photo.

Structured Data

Home has School JSON-LD with the name, description, logo, URL, and Houston, TX. Everything in it is on the page and passed with 0 errors and 0 warnings.

Image discoverability

I renamed the images from C1, C2, and C7 to names that actually describe them:

- Aaa-logo.svg (82x70): alt is “Advanced American Academy - Home” since it links to home. It is next to the nav.
- campus-hero-400w/800w/1200w.jpg (1200x560): alt describes the campus building. The h1 sits on it and the About Us mentions the building. It is also my og:image.
- classroom-students-400w/800w/1200w.jpg (1200x800): alt describes the students at their desks. It is next to the Upcoming Events table.

Validation

- Nu HTML checker: 0 errors on all 4 pages.
- Lighthouse SEO: 100 on all 4 pages. The Contact page was 91 in Module 5 because it didn’t have a description.
- Schema Markup Validator: School found, 0 errors
- LinkedIn Post Inspector: correct preview, with index.html as the canonical.

All screenshots and reports for these checks are in the [discoverability-&-structured-content-package](#) folder.

Claims I Won’t Make

My checks show that the tags are valid but doesn’t show where the site ranks.

- That AAA is “One of the Houston’s largest.” This is in the About Us, but I can’t factually back it up so it isn’t in the metadata.
- That JSON-LD boosts ranking. It doesn’t, and School isn’t a rich result type
- That Google will show my exact title and description. Google can rewrite both.
